UltraCade Kit Power Supply

Some UltraCade kits have the power supply incorrectly wired for the 12VDC and 5VDC power wires used for the computer and USBlinx coming from the power supply. This can cause the video output for CGA and EGA from the USBlinx to stop working.

Please verify the UltraCade kit power supply is correctly wired before powering on the cabinet. Use the picture below to verify the 12volt (yellow wires) and 5volt (red wires) power wires are correctly installed on the power supply.
